

CEILING LIGHT ILLUMINATED DISPLAY

Abstract

A backlit display system including a main body which is formed from a single sheet of flexible light-transmissive material. The display system can be shifted from a compact, substantially flat collapsed position to an assembled position with minimal effort by simply folding the main body along predetermined bend lines. Once the main body is assembled, hooks can be attached to the ends of the main body, and the hooks used to couple the display system to a suspended ceiling under a light source. Graphical and/or textual information on or in the main body is illuminated by light emitted from the light source for easy viewing by persons traveling under the display system.
